

## MEDIA STATISTICS & PROBABILITY

Probability and statistics are presented through the media in a variety of different contexts.

STATISTICS is the collection and analysis of data

STATISTICS are collected from real-life events / studies

Like probability, statistics help predict results of future events

### EXAMPLES OF STATISTICS

*Opinion polls, Census data, Weather reports,  
Gambling odds, sports reports (team data, player data)*

### EXAMPLE Favourite Music Statistics

A local radio station surveyed 200 students from one high school to determine their favourite type of music. The results are shown in the table.

Music	% of Students
Rock	45
Rap	35
Country	20

a) Express each percent as a decimal, and as a fraction in lowest terms.

$$\begin{aligned} \text{Rock} \\ 45\% &= \frac{45}{100} \\ &= 0.45 \end{aligned}$$

$$\frac{45}{100} = \frac{9}{20}$$

$$\begin{aligned} \text{Rap} \\ 35\% &= \frac{35}{100} \\ &= \frac{7}{20} \end{aligned}$$

$$= 0.35$$

$$\begin{aligned} \text{Country} \\ 20\% &= \frac{20}{100} \\ &= \frac{1}{5} \\ &= 0.20 \end{aligned}$$

b) If there are 4000 high school students in the city, how many of them would you expect to like each type of music?

$$\begin{aligned} \text{Rock} \\ 45\% \text{ of } 4000 \\ &= 0.45 \times 4000 \\ &= 1800 \end{aligned}$$

$$\begin{aligned} \text{Rap} \\ 35\% \text{ of } 4000 \\ &= 0.35 (4000) \\ &= 1400 \end{aligned}$$

$$\begin{aligned} \text{Country} \\ 20\% \text{ of } 4000 \\ &= 0.2 (4000) \\ &= 800 \end{aligned}$$

c) Is it possible that the poll might not be accurate? What factors could have influenced the responses?

*Yes. Influencing factors could include*

- type of music played by station doing the survey.*
- popular music teachers*
- etc.*

**EXAMPLE Statistics and Probability**

All students at a high school were surveyed about two sports. The results are shown in the graph.

- a) Express each as a decimal.

$$\frac{\text{Basketball}}{1195} = \frac{190}{1195} = 0.16$$

$$\frac{\text{Football}}{1195} = \frac{340}{1195} = 0.28$$

$$\frac{\text{both}}{1195} = \frac{565}{1195} = 0.47$$

$$\frac{\text{Neither}}{1195} = \frac{100}{1195} = 0.08$$

- b) What is the probability that a student chosen at random likes basketball, but not football?

$$P(\text{basketball}) = \frac{190}{1195} = 16\%$$

- c) What is the probability that a student chosen at random likes either basketball or football, but not both?

$$\begin{aligned} P(\text{basketball OR football}) &= \frac{(190 + 340)}{1195} \\ &= \frac{530}{1195} \\ &= 0.44 \text{ or } 44\% \end{aligned}$$

- d) What is the probability that a student chosen at random likes basketball or football or both

$$\begin{aligned} P(\text{Basketball, Football, or both}) &= \frac{(190 + 340 + 565)}{1195} \\ &= \frac{1095}{1195} \\ &= 92\% \end{aligned}$$
